

asobicoïn

Dean Eigenmann - ZK Labs - 20/8/18

This document has been created to verify the deployment of the asobitcoin token.

The commit compared against is 7e3b4.

No issues were detected in the usage of Open Zeppelin or in the manner of which the token contract was deployed.

Token

The token contract uses Open Zeppelin v1.10.0.

The total token supply is set to 16500000000 ether, the ether keyword ensures that there are 18 decimals. This means that the amount of tokens in existence are $16500000000 * 10^{18}$.

The token name is set to `ASOBI_COIN`. The token symbol is set to `ABX`. The token decimal amount is set to `18`.

Deployed

The contract is deployed at 0x49ceb57714000f18f3749cf2d130e135f9c473a4.

At the time of writing (block [#6180298](#)), the `totalSupply` is at 0, this means no tokens have been minted yet.

Minting can still be executed as it is not marked as finished.

The decimal amount is properly deployed as 18, and the token cap is 1650000000000000000000000000, which when taking decimals into account $1650000000000000000000000000 / 10^{**18}$ equals to the previously specified 165000000000.
